<sup>2</sup>Another Institute

## HEADING HERE

Your content goes here. The columns are determined manually, so if the column grows too long, it flows outside the page instead of wrapping to the next column. It's your responsibility to make sure the text fits the columns.

Most common  $\LaTeX$  environments should work normally inside the poster environment. At least figure, table and lists work.

Sections aren't numbered so using labels and ref to refer to sections makes no sense. You can use labels and ref normally to refer to figures and tables. Bibliography probably doesn't work, but I haven't tested. Posters shouldn't have that many references that writing them by hand would be too much.

## ANOTHER SECTION

This is the first section of the second column. The widths of the columns are fixed by either the `twocolumn` or `threecolumn` options. Therefore this three-column template should have exactly three `\newcolumn` commands. Any more or less will just mess up the layout.

## YET ANOTHER SECTION

This is the first section of the third column.
